

Nonlinear constraints in SCIP

Ksenia Bestuzheva and **Stefan Vigerske**

SCIP Online Workshop 2020 · June 3, 2020

Mixed-Integer Nonlinear Programming

$$\begin{aligned} \min \quad & c^T x \\ \text{s.t.} \quad & g_k(x) \leq 0 \quad \forall k \in [m] \\ & x_i \in \mathbb{Z} \quad \forall i \in \mathcal{I} \subseteq [n] \\ & x_i \in [\ell_i, u_i] \quad \forall i \in [n] \end{aligned}$$

- The functions $g_k : [\ell, u] \rightarrow \mathbb{R}$ can be

convex

and are given in algebraic form.

or

nonconvex

- SCIP solves MINLPs by spatial Branch & Bound.

The “classical” framework for (MI)NLP in SCIP

Expression trees and graphs

cons_nonlinear stores **algebraic structure** of nonlinear constraints in **one** directed acyclic graph:

- nodes: variables, operations, constraints
- arcs: flow of computation

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

Expression trees and graphs

cons_nonlinear stores **algebraic structure** of nonlinear constraints in **one** directed acyclic graph:

- nodes: variables, operations, constraints
- arcs: flow of computation

Operators:

- variable index, constant
- $+$, $-$, $*$, \div
- \cdot^2 , $\sqrt{\cdot}$, \cdot^p ($p \in \mathbb{R}$), \cdot^n ($n \in \mathbb{Z}$),
 $x \mapsto x|x|^{p-1}$ ($p > 1$)
- exp, log
- min, max, abs
- \sum , \prod , affine-linear, quadratic, signomial
- (user)

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

Expression trees and graphs

cons_nonlinear stores **algebraic structure** of nonlinear constraints in **one** directed acyclic graph:

- nodes: variables, operations, constraints
- arcs: flow of computation

Operators:

- variable index, constant
- $+$, $-$, $*$, \div
- \cdot^2 , $\sqrt{\cdot}$, \cdot^p ($p \in \mathbb{R}$), \cdot^n ($n \in \mathbb{Z}$),
 $x \mapsto x|x|^{p-1}$ ($p > 1$)
- exp, log
- min, max, abs
- \sum , \prod , affine-linear, quadratic, signomial
- (user)

Additional constraint handler: quadratic, abspower ($x \mapsto x|x|^{p-1}$, $p > 1$), SOC

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

Reformulation in cons_nonlinear (during presolve)

Goal: Reformulate constraints such that only elementary cases (convex, concave, odd power, quadratic) remain.

Example:

$$g(x) = \sqrt{\exp(x_1^2) \ln(x_2)}$$
$$x_1 \in [0, 2], \quad x_2 \in [1, 2]$$

- reformulates constraints by introducing new variables and new constraints
- other constraint handler can participate

Reformulation in cons_nonlinear (during presolve)

Goal: Reformulate constraints such that only elementary cases (convex, concave, odd power, quadratic) remain.

Example:

$$g(x) = \sqrt{\exp(x_1^2) \ln(x_2)}$$
$$x_1 \in [0, 2], \quad x_2 \in [1, 2]$$

Reformulation:

$$g = \sqrt{y_1}$$

$$y_1 = y_2 y_3$$

$$y_2 = \exp(y_4)$$

$$y_3 = \ln(x_2)$$

$$y_4 = x_1^2$$

- reformulates constraints by introducing new variables and new constraints
- other constraint handler can participate

Reformulation in cons_nonlinear (during presolve)

Goal: Reformulate constraints such that only elementary cases (convex, concave, odd power, quadratic) remain.

Example:

$$g(x) = \sqrt{\exp(x_1^2) \ln(x_2)}$$
$$x_1 \in [0, 2], \quad x_2 \in [1, 2]$$

Reformulation:

$$g = \sqrt{y_1}$$

$$y_1 = y_2 y_3 \quad [0, \ln(2)e^4]$$

$$y_2 = \exp(y_4) \quad [1, e^4]$$

$$y_3 = \ln(x_2) \quad [0, \ln(2)]$$

$$y_4 = x_1^2 \quad [0, 4]$$

- reformulates constraints by introducing new variables and new constraints
- other constraint handler can participate

Bounding: LP relaxation

- relaxing integrality
- convexifying non-convexities
- linearizing nonlinear convexities

convex functions

concave functions

x^k ($k \in 2\mathbb{Z} + 1$)

$x \cdot y$

Branching

1. **fractional** integer variables
2. variables in violated **nonconvex** constraints, because variable bounds determine the convex relaxation, e.g.,

$$x^2 \leq \ell^2 + \frac{u^2 - \ell^2}{u - \ell}(x - \ell) \quad \forall x \in [\ell, u].$$

Bound Tightening

- Many constraint handler in SCIP implement a fairly cheap bound tightening (aka. **domain propagation**) method to infer tighter variable bounds from constraints and current variable bounds.

Bound Tightening

- Many constraint handler in SCIP implement a fairly cheap bound tightening (aka. **domain propagation**) method to infer tighter variable bounds from constraints and current variable bounds.
- `cons_nonlinear` utilizes the expression graph and **interval arithmetic**

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

Bound Tightening

- Many constraint handler in SCIP implement a fairly cheap bound tightening (aka. **domain propagation**) method to infer tighter variable bounds from constraints and current variable bounds.
- cons_nonlinear utilizes the expression graph and **interval arithmetic**
- **Forward propagation**:
 - compute bounds on intermediate nodes (top-down)

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

$$[2, 23.47] \cap [-\infty, 4] = [2, 4]$$

Bound Tightening

- Many constraint handler in SCIP implement a fairly cheap bound tightening (aka. **domain propagation**) method to infer tighter variable bounds from constraints and current variable bounds.
- cons_nonlinear utilizes the expression graph and **interval arithmetic**
- **Forward propagation**:
 - compute bounds on intermediate nodes (top-down)
- **Backward propagation**:
 - reduce bounds using reverse operations (bottom-up)

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

Bound Tightening

$$\log(x)^2 + 2 \log(x)y + y^2 \in [-\infty, 4]$$
$$x, y \in [1, 4]$$

Further Techniques

Primal Heuristics:

- NLP solving: subnlp, nlpdiving, multistart, mpec
- MINLP solving: LNS heuristics (RENS, RINS, DINS, etc.)
- MIP solving: undercover

Further Techniques

Primal Heuristics:

- NLP solving: subnlp, nlpdiving, multistart, mpec
- MINLP solving: LNS heuristics (RENS, RINS, DINS, etc.)
- MIP solving: undercover

Tighter Relaxations:

- second-order cone upgrade of quadratic constraints
- adding KKT reformulation (using SOS1) for QPs
- $x \cdot y$ over 2D projections of the LP relaxation
- separation for edge-concave quadratic constraints (off by default)
- projection of LP relaxation onto convex feasible sets (off by default)

Further Techniques

Primal Heuristics:

- NLP solving: subnlp, nlpdiving, multistart, mpec
- MINLP solving: LNS heuristics (RENS, RINS, DINS, etc.)
- MIP solving: undercover

Tighter Relaxations:

- second-order cone upgrade of quadratic constraints
- adding KKT reformulation (using SOS1) for QPs
- $x \cdot y$ over 2D projections of the LP relaxation
- separation for edge-concave quadratic constraints (off by default)
- projection of LP relaxation onto convex feasible sets (off by default)

More Bound Tightening:

- Optimization-Based Bound Tightening: $\min / \max x_i$ w.r.t. LP relaxation
- nl. Optimization-Based Bound Tightening: $\min / \max x_i$ w.r.t. convex NLP relaxation (off by default)

A MINLP can be input via

- **File readers:** FlatZinc*, LP*, MPS*, OSiL, PIP[†], ZIMPL
- **Interfaces:** AMPL, C, GAMS, Java*, Julia/JuMP, Matlab (via OPTI Toolbox), Python

SCIP can utilize this software for MINLP solving:

- **NLP Solvers:** Ipopt, FilterSQP, WORHP
- **Automatic Differentiation:** CppAD

*quadratic only

†polynomial only

Example: Circle Packing

Stefan, you need to switch screen to Ksenia now.

**A new framework for NLP in SCIP
(work in progress)**

**by K. Bestuzheva, B. Müller, F. Serrano, S.
Vigerske, F. Wegscheider**

Problem with current implementation

Consider

$$\min z$$

$$\text{s.t. } \exp(\ln(1000) + 1 + xy) \leq z$$

$$x^2 + y^2 \leq 2$$

An optimal solution:

$$x = -1$$

$$y = 1$$

$$z = 1000$$

Problem with current implementation

Consider

$$\begin{aligned} \min z \\ \text{s.t. } \exp(\ln(1000) + 1 + xy) \leq z \\ x^2 + y^2 \leq 2 \end{aligned}$$

An optimal solution:

$$\begin{aligned} x &= -1 \\ y &= 1 \\ z &= 1000 \end{aligned}$$

$$w = 6.907754936$$

⇒ **Explicit reformulation** of constraints ...

- ... **loses the connection to the original problem.**
- ... **loses distinction between original and auxiliary variables.** Thus, we may branch on auxiliary variables.
- ... **prevents simultaneous exploitation of overlapping structures.**

Everything is an expression.

- **ONE** constraint handler: `cons_expr`
- represent all nonlinear constraints in **one expression graph** (DAG)

$$\text{lhs} \leq \text{expression-node} \leq \text{rhs}$$

- all algorithms (check, separation, propagation, etc.) work on the expression graph
(no upgrades to specialized nonlinear constraints)

Everything is an expression.

- **ONE** constraint handler: `cons_expr`
 - represent all nonlinear constraints in **one expression graph** (DAG)
$$\text{lhs} \leq \text{expression-node} \leq \text{rhs}$$
 - all algorithms (check, separation, propagation, etc.) work on the expression graph
(no upgrades to specialized nonlinear constraints)
 - **separate expression operators** (+, ×) and **high-level structures** (quadratic, etc.)
- ⇒ **avoid redundancy / ambiguity** of expression types (classic: +, \sum , linear, quad., ...)
- stronger identification of **common subexpressions**

Everything is an expression.

- **ONE** constraint handler: `cons_expr`

- stronger identification of **common subexpressions**

Do not reformulate constraints.

- introduce **auxiliary variables for the relaxation only**

Constraint:

$$\log(x)^2 + 2 \log(x)y + y^2 \leq 4$$

This formulation is used to

- check feasibility,
- presolve,
- propagate domains, ...

Constraint:

$$\log(x)^2 + 2 \log(x)y + y^2 \leq 4$$

This formulation is used to

- check feasibility,
- presolve,
- propagate domains, ...

(Implicit) Reformulation:

$$w_1 \leq 4$$

$$\log(x)^2 + 2 \log(x)y + y^2 = w_1$$

Constraint:

$$\log(x)^2 + 2\log(x)y + y^2 \leq 4$$

This formulation is used to

- check feasibility,
- presolve,
- propagate domains, ...

(Implicit) Reformulation:

$$w_1 \leq 4$$

$$w_2 + 2w_3 + w_4 = w_1$$

$$\log(x)^2 = w_2$$

$$\log(x)y = w_3$$

$$y^2 = w_4$$

Constraint:

$$\log(x)^2 + 2 \log(x)y + y^2 \leq 4$$

This formulation is used to

- check feasibility,
- presolve,
- propagate domains, ...

(Implicit) Reformulation:

$$w_1 \leq 4$$

$$w_2 + 2w_3 + w_4 = w_1$$

$$w_5^2 = w_2$$

$$w_5 y = w_3$$

$$y^2 = w_4$$

$$\log(x) = w_5$$

Enforcement

Constraint:

$$\log(x)^2 + 2 \log(x)y + y^2 \leq 4$$

This formulation is used to

- check feasibility,
- presolve,
- propagate domains, ...

(Implicit) Reformulation:

$$w_1 \leq 4$$

$$w_2 + 2w_3 + w_4 = w_1$$

$$w_5^2 = w_2$$

$$w_5 y = w_3$$

$$y^2 = w_4$$

$$\log(x) = w_5$$

Used to construct LP relaxation.

Each **operator type** (+, ×, pow, etc.) is implemented by an **expression handler**, which can provide a number of callbacks:

- **evaluate and differentiate** expression w.r.t. operands
- interval evaluation and **tighten bounds** on operands
- provide linear **under- and over-estimators**
- inform about curvature, monotonicity, integrality
- simplify, compare, print, parse, hash, copy, etc.

Expression handler are like other **SCIP plugins**, thus new ones can be added by users.

Exploiting structure

Constraint: $\log(x)^2 + 2\log(x)y + y^2 \leq 4$

Smarter reformulation:

- Recognize that $\log(x)^2 + 2\log(x)y + y^2$ is **convex in $(\log(x), y)$** .

Exploiting structure

Constraint: $\log(x)^2 + 2\log(x)y + y^2 \leq 4$

Smarter reformulation:

- Recognize that $\log(x)^2 + 2\log(x)y + y^2$ is **convex in $(\log(x), y)$** .
- ⇒ Introduce auxiliary variable for $\log(x)$ only.

$$w^2 + 2wy + y^2 \leq 4$$

$$\log(x) = w$$

Handle $w^2 + 2wy + y^2 \leq 4$ as convex constraint (“gradient-cuts”).

Constraint: $\log(x)^2 + 2\log(x)y + y^2 \leq 4$

Smarter reformulation:

- ⇒ Introduce auxiliary variable for $\log(x)$ only.

$$w^2 + 2wy + y^2 \leq 4$$

$$\log(x) = w$$

Handle $w^2 + 2wy + y^2 \leq 4$ as convex constraint (“gradient-cuts”).

Nonlinearity Handler (nlhdlrs):

- Adds **additional separation and propagation** algorithms for structures that can be identified in the expression graph.
- **Attached to nodes in expression graph**, but **does not define expressions** or constraints.
- Examples: quadratics, convex subexpressions, vertex-polyhedral

Nonlinearity Handler in Expression Graph

- Nodes in the expression graph can have one or several nlhdlrs attached.
- At beginning of solve, **detection callbacks** are run **only** for nodes that have **auxiliary variable**. Detection callback may **add auxiliary variables**.

Nonlinearity Handler in Expression Graph

 - `nlhdlr_quadratic` detects a **convex quadratic structure** and signals success.
 - `nlhdlr_quadratic` **adds an auxiliary variable** w_2 for `log` node.
3. Run detect of all nlhdlrs on `log` node.

Nonlinearity Handler in Expression Graph

- Nodes in the expression graph can have one or several nlhdlrs attached.
- At beginning of solve, **detection callbacks** are run **only** for nodes that have **auxiliary variable**. Detection callback may **add auxiliary variables**.

Constraint: $\log(x)^2 + 2 \log(x)y + y^2 \leq 4$

$$w_1 \leq 4$$

$$w_2^2 + 2w_2y + y^2 \leq w_1 \quad [\text{nlhdlr_quadratic}]$$

$$\log(x) = w_2 \quad [\text{expr_log}]$$

1. Add auxiliary variable w_1 for root.
2. Run detect of all nlhdlrs on $+$ node.
 - `nlhdlr_quadratic` detects a **convex quadratic structure** and signals success.
 - `nlhdlr_quadratic` **adds an auxiliary variable** w_2 for `log` node.
3. Run detect of all nlhdlrs on `log` node.
 - No specialized `nlhdlr` signals success. The expression handler will be used.

Current status

Available features:

- Handler for **quadratic** subexpressions
- Handler for **second-order cone** structures
- Handler for **convex and concave** subexpressions
- Handler for functions on **semi-continuous** variables (**perspective** formulations)
- Handler for **bilinear terms** ($x \cdot y$ over 2D projection of LP relaxation)
- **RLT** (Reformulation-Linearization Technique) separator for bilinear terms
- Separator for SDP cuts on 2×2 principal minors of $X - xx^T \succeq 0$
- Linearization of **products of binary** variables
- **Symmetry** detection
- Support for operators **cos**, **sin**, **entropy**
- ...

Current status

- Linearization of **products of binary** variables
- **Symmetry** detection
- Support for operators **cos, sin, entropy**
- ...

Main open tasks before release:

- check **performance** “outliers”
- replacing **remaining classic code** by new one (in particular NLP relaxation and NLP solver interfaces)
- **documentation** “?”

Nonlinear constraints in SCIP
